EDUCATION

Gujarat Technological University *May 2026*
Bachelor of Engineering in Computer Engineering CPI: 9.10

The Radiant International School, Surat *2022*
Higher Secondary Education - GSEB Percentage: 90.78

Experience

AI/ML Engineer — Canopas, Gujarat *Jan'26 - Present*

- Currently working as an AI Engineer, developing AI/ML and Generative AI solutions using LLMs, RAG, embeddings, and Python. Building and integrating scalable AI applications focused on real-world business use cases and production deployment.

Gen AI Development Intern — Code4x, Bengaluru *Dec'25 - Jan'26*

- Contributed to the maintenance and enhancement of an AI-powered e-commerce operations agent using LLMs, RAG, and tool calling to automate order management workflows. Developed workflows to understand customer requests, retrieve order and product information, verify refund and replacement policies, track shipments, and execute actions through APIs, enabling faster and more efficient customer order resolution.

Company Projects

Voice Customer Support Agent

- Assisted in maintaining and enhancing an AI-powered voice customer support agent for a jewelry brand, enabling customers to interact naturally through voice. Worked with speech recognition, LLM-based reasoning, tool calling, and API/database integrations to handle queries related to order status, product details, availability, returns, exchanges, and delivery, with emphasis on low-latency and reliable real-time interactions.

Financial Document Intelligence — LLM Fine-Tuning and RAG

- Participated in building and improving a financial document analysis system that combined LoRA-based LLM fine-tuning with RAG for financial question answering and information extraction from annual reports. Handled components involving PDF extraction, dataset preparation, document retrieval, financial metric extraction, question answering, summarization, and evidence-based response generation.

ETA Prediction and Monitoring System

- Supported the development and monitoring of a machine learning–based delivery ETA prediction system using distance, traffic, weather, location, time, driver, restaurant, road-condition, and historical delivery data. Worked on probabilistic ETA predictions, confidence intervals, and real-time monitoring by comparing predicted and actual delivery times to evaluate prediction reliability and model performance.

Duplicate Document Detection System

- Contributed to an AI-powered document duplicate detection system for identifying duplicate and near-duplicate documents across large document collections. Supported OCR, text and image embedding generation, metadata analysis, and vector similarity search to compare documents and generate duplicate probability scores, enabling efficient and scalable document deduplication.

Portfolio Projects

Company Policy Question and Answer Bot Preview
Technologies Used : Python, Streamlit, LangChain, FAISS, Ollama, RAG(Retrieval-

Augmented Generation), Vector Embeddings

- Developed an AI-powered company policy QA application that allows users to upload policy documents, process and index content, and ask natural-language questions. Implemented document chunking, vector embeddings, FAISS-based semantic search, RAG, and local LLM inference to retrieve relevant policy information and generate accurate, context-aware answers.

AUTODS – Autonomous Data Scientist Preview
Technologies Used : Flask, pandas, NumPy, scikit-learn, XGBoost, Docker,Chart.js, HTML, CSS, and JavaScript

- Built an end-to-end AutoML web application that automates data cleaning, exploratory data analysis, feature selection, model training, cross-validation, and performance evaluation. Implemented multiple ML model comparison, automated preprocessing, feature importance analysis, real-time predictions, interactive data visualizations, and result export through a user-friendly dashboard.

FaceID - Face Recognition Attendance System Preview
Technologies used : Python, Flask, OpenCV, CSV Data Management, Docker

- Designed an AI-powered face recognition attendance system that automates student attendance using face detection, facial recognition, and real-time webcam integration. Implemented student registration, face model training, automated attendance marking, secure data storage, attendance report generation, password-protected admin controls, and email-based report sharing through a Flask web interface.

Technologies

Languages: Python, C, HTML, CSS , JavaScript(Basic)

Databases: MySQL, PostgreSQL, MongoDB

Technologies: Data science, AI/ML Concepts, Agentic AI, FastAPI, Flask, Django, TensorFlow, N8n, MYSQL, Firebase

Tools: Git, GitHub, Docker, VS Code, Kubernetes, n8n, Google Colab, Jupyter Notebook, Anaconda, MongoDB compass, Android Studio

Concepts: DSA, OOP, DBMS, Operating Systems, Computer networks

Soft Skills: Communication, Problem solving, Teamwork, Time Management

Achievements & Certifications

- Machine learning and Deep learning - Complete course (Udemy)
- Participated in SIH 2024 - Smart India Hackathon
